# Web Tech isa 2 Quiz Documentation

Function DisplayQuestion takes parameters as 1 or -1
If 1 then next page , else previous page.

Each question has a class called page which is accessed by
document.getElementsByClassName() which returns an array of all questions.

The function nextPrev() displays the next or previous depending on the value of the
DisplayQuestion
For the value 1 the function will show the next form in the array and will hide the previous page.
And for -1 the function will hide the current page and display the previous page in an array.

The currentTab holds the array of pages
CurrentTab[0] is the home page

The CheckResults Function take the input from each page and checks if any of the three of the
radio buttons have been checked or not
If checked it sends the value of the radio button to an array called receivedAns which contains
the answers which the user gives.

Later it checks the receivedAns array with a predefined array called correctAns which contains
the correct answers of the quiz
The comparison of answers is done by iterating through both the array and checking for their
corresponding keys.

If the answers match then a variable inc increments by 1

The displayAns function displays the answers of the user inputs to the end of the quiz and also displays the correct answers corresponding to them.
